Strings

Victor Eijkhout, Susan Lindsey

Fall 2023

last formatted: February 6, 2024

Characters

1. Characters and ints

- Type `char`;
- represents '7-bit ASCII': printable and (some) unprintable characters.
- Single quotes: `char c = 'a'`

2. Char / int equivalence

Equivalent to (short) integer:

Code:

```
1 // string/intchar.cpp
2 char ex = 'x';
3 int x_num = ex, y_num = ex+1;
4 char why = y_num;
5 cout << "x is at position " << x_num
6      << '\n';
7 cout << "one further lies " << why
8      << '\n';
```

Output:

```
x is at position 120
one further lies y
```

Also: `'x'-'a'` is distance a--x

Exercise 1

Write a program that accepts an integer $1 \cdots 26$ and prints the so-manieth letter of the alphabet.

Extend your program so that if the input is negative, it prints the minus-so-manieth uppercase letter of the alphabet.

Strings

3. String declaration

```
#include <string>
using std::string;

// .. and now you can use `string'
```

(Do not use the C legacy mechanisms.)

4. String creation

A string variable contains a string of characters.

```
string txt;
```

You can initialize the string variable or assign it dynamically:

```
string txt{"this is text"};
string moretxt("this is also text");
txt = "and now it is another text";
```

5. Quotes in strings

You can escape a quote, or indicate that the whole string is to be taken literally:

Code:

```
1 // string/quote.cpp
2 string
3   one("a b c"),
4   two("a \"b\" c"),
5   three( R"("a ""b """c)" );
6 cout << one << '\n';
7 cout << two << '\n';
8 cout << three << '\n';
```

Output:

```
a b c
a "b" c
"a ""b """c
```

6. Concatenation

Strings can be *concatenated*:

Code:

```
1 // string/strings.cpp
2 string my_string, space{" "};
3 my_string = "foo";
4 my_string += space + "bar";
5 cout << my_string << ": " <<
       my_string.size() << '\n';
```

Output:

```
foo bar: 7
```

7. String indexing

You can query the *size*:

Code:

```
1 // string/strings.cpp
2 string five_text{"fiver"};
3 cout << five_text.size() << '\n';
```

Output:

```
5
```

or use subscripts:

Code:

```
1 // string/stringsub.cpp
2 string digits{"0123456789"};
3 cout << "char three: "
4      << digits[2] << '\n';
5 cout << "char four : "
6      << digits.at(3) << '\n';
```

Output:

```
char three: 2
char four : 3
```

8. Ranging over a string

Same as ranging over vectors.

Range-based for:

Code:

```
1 // string/stringrange.cpp
2 cout << "By character: ";
3 for ( char c : abc )
4   cout << c << " ";
5 cout << '\n';
```

Output:

```
By character: a b c
```

Ranging by index:

Code:

```
1 // string/stringrange.cpp
2 string abc = "abc";
3 cout << "By character: ";
4 for (int ic=0; ic<abc.size(); ic++)
5   cout << abc[ic] << " ";
6 cout << '\n';
```

Output:

```
By character: a b c
```

9. Range with reference

Range-based for makes a copy of the element
You can also get a reference:

Code:

```
1 // string/stringrange.cpp
2 for ( char &c : abc )
3   c += 1;
4 cout << "Shifted: " << abc << '\n';
```

Output:

```
Shifted: bcd
```

Review quiz 1

True or false?

1. `'0'` is a valid value for a `char` variable
   `/poll "single-quote 0 is a valid char" "T" "F"`
2. `"0"` is a valid value for a `char` variable
   `/poll "double-quote 0 is a valid char" "T" "F"`
3. `"0"` is a valid value for a `string` variable
   `/poll "double-quote 0 is a valid string" "T" "F"`
4. `'a'+'b'` is a valid value for a `char` variable
   `/poll "adding single-quote chars is a valid char" "T" "F"`

Exercise 2

The oldest method of writing secret messages is the Caesar cipher. You would take an integer s and rotate every character of the text over that many positions:

$$s \equiv 3\text{: "acdz"} \Rightarrow \text{"dfgc"}.$$

Write a program that accepts an integer and a string, and display the original string rotated over that many positions.

10. More vector methods

Other methods for the vector class apply: `insert`, `empty`, `erase`, `push_back`, et cetera.

Code:

```
1 // string/strings.cpp
2 string five_chars;
3 cout << five_chars.size() << '\n';
4 for (int i=0; i<5; ++i)
5   five_chars.push_back(' ');
6 cout << five_chars.size() << '\n';
```

Output:

```
0
5
```

Methods only for `string`: `find` and such.

`http://en.cppreference.com/w/cpp/string/basic_string`

Exercise 3

Write a function to print out the digits of a number: `156` should print `one five six`. You need to convert a digit to a string first; can you think of more than one way to do that?

Start by writing a program that reads a single digit and prints its name.

For the full program it is easiest to generate the digits last-to-first. Then figure out how to print them reversed.

Optional exercise 4

Write a function to convert an integer to a string: the input 215 should give `two hundred fifteen`, et cetera.

11. String stream

Like cout (including conversion from quantity to string), but to object, not to screen.

- Use the << operator to build it up; then
- use the *str* method to extract the string.

```
1 #include <sstream>
2 stringstream s;
3 s << "text" << 1.5;
4 cout << s.str() << endl;
```

12. String an object, 1

Define a function that yields a string representing the object, and

```
1 // geom/pointfunc.cpp
2   string as_string() {
3     stringstream ss;
4     ss << "(" << x << "," << y << ")";
5     return ss.str();
6   };
7     /* ... */
8 std::ostream& operator<<
9 (std::ostream &out,Point &p) {
10   out << p.as_string(); return out;
11 };
```

13. String an object, 2

Redefine the less-less operator to use this.

```
1 // geom/pointfunc.cpp
2 Point p1(1.,2.);
3 cout << "p1 " << p1
4      << " has length "
5      << p1.length() << "\n";
```

Exercise 5

Use integer output to print real numbers aligned on the decimal:

Code:

```
1 // io/quasifix.cpp
2 string quasifix(double);
3 int main() {
4   for ( auto x : { 1.5, 12.32,
       123.456, 1234.5678 } )
5     cout << quasifix(x) << '\n';
```

Output:

```
   1.5
  12.32
 123.456
1234.5678
```

Use four spaces for both the integer and fractional part; test only with numbers that fit this format.
